Brief relevant history

NC

1947 – US Air Force needs lead John *Parsons* to develop a machine able to produce parts described in 3D.

1949 – Contract with *Parsons Corporation* to implement to proposed method.

1952 – Demonstration at MIT of a working machine tool (NC), able to produce parts resorting to simultaneous interpolation on several axes.

1955 – First NC machine tools reach the market.

1957 - NC starts to be accepted as a solution in industrial applications, with first machines starting to produce.

197x – Profiting from the microprocessor invention appears the CNC.

Footnotes:

1939-1945 – Second World War, 1947-1991 – Cold war; 1968 – Bedford/GM PLC, 1975-1979 – GRAFCET

Evolution in brief

CAD/CAM and CNC

Modification of existing machine tools with **motion sensors** and **automatic advance** systems.

Closed-loop control systems for **axis control**.

Incorporation of the **computational advances** in the CNC machines.

Development of high accuracy interpolation algorithms to trajectory interpolation.

Resort to **CAD** systems to design parts and to manage the use of CNC machines.

Industrial areas of application:

• Aerospace

• *Electronics*

- e.g. designing and testing wing and blade profiles
- Automobiles e.g. concept car design
- *Moulds/Dies* e.g. bottle caps, gears, hard shell luggage
 - e.g. mounting components on PCBs
- *Machinery* e.g. iCub

WorkNC CAD/CAM software by Sescoi

iCub head design at IST

CAD/CAM and CNC Methodology CAD/CAM

Use technical data from a *database* in the design and production stages. Information on parts, materials, tools, and machines are *integrated*.

> CAD (Computer Aided Design) Allows the design in a computer environment. Ideas $\rightarrow Design$

CAM (Computer Aided Manufacturing) To manage programs and production stages on a computer. $Design \rightarrow Product$

CAD/CAM and CNC Methodology CAD/CAM

Objectives

- Increase accuracy, reliability, and ability to introduce changes/new designs
- Increase workload
- Reduce production costs
- Reduce waste due to errors and other human factors
- Carry out complex tasks (e.g. Simultaneous 3D interpolation)
- Increase precision of the produced parts.

Advantages

- Reduce the production/delivery time
- Reduce **costs** associated to parts and other auxiliary
- Reduce storage space
- Reduce time to start production
- Reduce machining time
- Reduce **time to market** (on the design/redesign and production).

Limitations

- High initial **investment** (30k€ to 1500k€)
- Specialized maintenance required
- Does not eliminate the human errors completely
- Requires more specialized **operators**
- Not so relevant the advantages on the production of small or very small series.

CAD/CAM and CNC Tools

http://www.schaublinmachines.co.uk/machining-centres/160 CNC Fanuc.html

CAD/CAM and CNC Tools :

Attention to the constraints on the materials used ...

• Speed of advance • Speed of rotation • Type of tool

CAD/CAM and CNC Tools :

Micro-machined mirror, camera mounting, acquired images [IST/Portugal, USP/Brazil].

Tools: impact on the quality of finishing (μm)

Evolution of tools performance:

Tools: Energy Requirements

Approximate Energy Requirements in Cutting Operations (at drive motor, corrected for 80% efficiency; multiply by 1.25 for dull tools).

	Specific energy		
Material	$W \cdot s/mm^3$	$hp \cdot min/in.^3$	
Aluminum alloys	0.4-1.1	0.15-0.4	
Cast irons	1.6-5.5	0.6–2.0	
Copper alloys	1.4–3.3	0.5-1.2	
High-temperature alloys	3.3-8.5	1.2-3.1	
Magnesium alloys	0.4–0.6	0.15-0.2	
Nickel alloys	4.9-6.8	1.8–2.5	
Refractory alloys	3.8–9.6	1.1–3.5	
Stainless steels	3.0-5.2	1.1–1.9	
Steels	2.7-9.3	1.0-3.4	

CAD/CAM and CNC Evolution of Numerical Control

• Numerical Control (NC)

Data on paper or received in serial port NC machine unable to perform computations Hardware interpolation

- Direct Numerical Control (DNC) Central computer control a number of machines DNC or CNC
- Computer Numerical control (CNC) A computer is on the core of each machine tool Computation and interpolation algorithms run on the machine
- Distributive numerical control
 - Scheduling Quality control Remote monitoring

Interpolation

Motivation

CAD/CAM and CNC

Note1: The references are usually very **simple**, e.g. $Z_i(t)=a_it+b_i$

Note2: Step motors count steps, i.e. are **numerical integrators** hence we have to convert Z(t) to an **incremental representation** p_k

Interpolation: use incremental representation *Motivation from numerical integration*

Area of a function

$$z(t) = \int_0^t p(\tau) d\tau \cong \sum_{i=1}^k p_i \Delta t$$

Introducing z_k , as the value of z at t=k Δt

$$z_{k} = \sum_{i=1}^{k-1} p_{i} \Delta t + p_{k} \Delta t = z_{k-1} + \Delta z_{k}, \quad \Delta z_{k} = p_{k} \Delta t \quad \Rightarrow \quad p_{k} = \Delta z_{k} / \Delta t$$

The integrator works at a rhythm of $f=1/\Delta t$ and the function p is given app. by:

$$p_k = p_{k-1} \pm \Delta p_k$$

To be able to implement the integrator in registers with n bits, p must verify $p_k < 2^n$. In the following we will use p_k and Δp_k instead of z_k or z(t).

Implementation of a Digital Differential Analyzer (DDA)

The p register input is 0, $+1 = \Delta p$ or $-1 = -\Delta p$.

The q register stores the **area integration** value

$$q_k = q_{k-1} + p_k.$$

If the q register value exceeds (2ⁿ-1) an overflow occurs and $\Delta z=1$:

$$\Delta z_k = p_k / 2^n$$

Defining C=f/2ⁿ, and given that f=1/ Δt , one has a scale factor from p_k to Δz_k :

$$\Delta z_k = p_k \ C \ \Delta t$$

CAD/CAM and CNC **DDA for Linear Interpolation (1 axis):**

Example: let p=5, $\Delta p=0$ and assume q is a 3 bits register

Step	q	Δz	$\Sigma \Delta z$
1	5		0
2	2	1	1
3	7		1
4	4	1	2
5	1	1	3
6	6		3
7	3	1	4
8	0	1	5
9	5		5

CAD/CAM and CNC **DDA for Linear Interpolation (2 axis):**

(a) Specifications

(b) DDA solution

CAD/CAM and CNC Exponential Deceleration:

Let
$$p(t) = p_0 e^{-\alpha t} \implies dp = -\alpha p_0 e^{-\alpha t} dt$$

and
$$\frac{\Delta z}{\Delta t} = Cp_k = Cp_0 e^{-\alpha t}$$
.

The differential of p(t) is approximately

$$-\Delta p = \alpha p_k \Delta t$$

Setting C= α , i.e. f= $2^n\alpha$, one has

Example: $p(t)=15e^{-t}$

CAD/CAM and CNC Circular Interpolation:

Let
$$(X - R)^2 + Y^2 = R^2$$
 or
 $X = R(1 - \cos(\omega t))$
 $Y = R\sin(\omega t)$

The differential is

$$dX = \omega R \sin (\omega t) dt = d(-R \cos (\omega t))$$

$$dY = \omega R \cos (\omega t) dt = d(R \sin (\omega t))$$

Example: Circumference of radius 15, centered at the origin.

CAD/CAM and CNC **Full DDA**

2D Line, 2D Arc, Acceleration / Deceleration

CAD/CAM and CNC **Full DDA**

2D Line, 2D Arc, Acceleration / Deceleration

CNC Axes Control

DC motor - speed control

In the position control example, a proportional controller is enough to obtain *zero steady state error* in the position, i.e. output is Kr times a constant input. Why?

Speed control is preferred. Position based control tends to produce **not so smooth trajectories**. Note however that speed can be estimated from position sensors.

CAD/CAM and CNC Methodology CAD/CAM

Page 34

Summary of the previous slide:

CNC machines know how to do **interpolation**, but not how to machine a complete part.

CAM helps to bridge the gap between **object shapes** and making **material removal trajectories** (to be interpolated).

In other words, one needs to do **CNC programming**.

In the following: **G-code** (also RS-274), which has many variants, is the common name for the most widely used numerical control (NC) programming language.

Steps 1, 2, ... 6, to execute a part

1. Read and interpret the technical drawings

2. Choose the most adequate **machine** for the several stages of machining

Relevant features:

- The workspace of a machine versus the part to be produced
- The options available on each machine
- The tools that can be used
- The mounting and the part handling
- The operations that each machine can perform

3. Choose of the most adequate **tools**

Relevant features:

- The material to be machined and its characteristics
- Standard tools cost less
- The quality of the mounting part is function of the number of parts to produce
- Use the right tool for the job
- Verify if there are backup tools and/or stored available
- Take into account tool aging

4. Cutting data

- Spindle Speed speed of rotation of the cutting tool (rpm)
- Feedrate linear velocity of advance to machine the part (mm/minute)
- Depth of Cut depth of machining in z (mm)

5. Choice of the interpolation plane, in 2D $\frac{1}{2}$ machines

5.1. Unit system imperial / inches (G70) or international millimeters (G71).

5.2. Command mode* Absolute = use world coordinate system (G90) Relative = move w.r.t. the current position (G91)

* There are other command modes, e.g. helicoidal.

6. Data Input

Ν	Sequence Number
G	Preparatory Functions
X	X Axis Command
Y	Y Axis Command
Z	Z Axis Command
R	Radius from specified center
A	Angle ccw from +X vector
Ι	X axis arc center offset
J	Y axis arc center offset
K	Z axis arc center offset
F	Feed rate
S	Spindle speed
Τ	Tool number
Μ	Miscellaneous function

Preparatory functions (inc.)

G00 – GO

G02 – Circular Interpolation (CW)

G01 – Linear Interpolation

G03 – Circular Interpolation (CCW)

Canned Cycles

G81 – Drilling cycle with multiple holes

Special Cycles or Canned Cycles

G78 – Rectangular pocket cycle, used to clean a square shaped area

. . .

CAD/CAM and CNC - CNC Programming

Other preparatory functions

- G04 A temporary dwell, or **delay** in tool motion.
- G05 A permanent hold, or **stopping** of tool motion. It is canceled by the machine operator.
- G22 Activation of the stored **axis travel limits**, which are used to establish a safety boundary.
- G23 Deactivation of the stored axis travel limits.
- G27 Return to the machine **home** position via a programmed intermediate point
- G34 Thread cutting with an increasing lead.
- G35 Thread cutting with a decreasing lead.
- G40 Cancellation of any previously programmed tool radius compensation
- G42 Application of cutter radius compensation to the right of the workpiece with respect to the direction of tool travel.
- G43 Activation of tool length compensation in the same direction of the offset value
- G71 Canned cycle for multiple-pass turning on a lathe (foreign-made)

Miscellaneous functions

- M02 Program end
- M03 Start of spindle rotation clockwise
- M04 Start of spindle rotation counterclockwise
- M07 Start of **mist coolant** (spray)
- M08 Start of **flood coolant** (e.g. oil)

CAD/CAM and CNC Tool change

Tools are usually of easy access when the machines need the tools to be changed manually.

Most recent systems have an automated toolbox that allows tool selection without the need for human intervention.

Example of CNC programming

See http://www.ezcam.com/web/tour/tour.htm

Chap. 5 – CAD/CAM and CNC

CAD/CAM and CNC

Example of CNC programming

CAD/CAM and CNC Advanced CNC programming languages

- Automatically Program Tool (APT), developed at MIT in 1954
- Derived from APT: ADAPT (IBM), IFAPT (France), MINIAPT (Germany)
- Compact II
- Autospot
- SPLIT

Current trend in interpolation

Modern CAD systems have progressively gained the capability to describe a wide variety of complex shaped parts (like dies and molds) through parametric curves or surfaces like the Bezier, B-Spline or Non-Uniform Rational B-Spline (NURBS). (...) NURBS is one curve interpolator that draws considerable attention owing to the fact that NURBS offers a universal mathematical form for representing both analytical and free-form shapes [9]. In fact, most commercial CNC controller manufacturers (such as Fanuc [15] and Siemens [16]) incorporate such interpolation capabilities to their high-end CNC products.

In "Direct command generation for CNC machinery based on data compression techniques", U. Yaman, M. Dolen, Robotics and Computer-Integrated Manufacturing 29 (2013) 344–356

Rules of security

- Security is not facultative
- The eyes must be always protected.
- The tools and parts must be handled and installed properly.
- Avoid the use of large cloths
- Clean the parts with a brush, never with the hands.
- Be careful with you and the others.

Machine operation

Operation rules

Verify tolerances and tools offsets for proper operation

Load program Follow up machine operation Verify carefully the produced part.

3D-printed gun on display at V&A museum

By Sophie Curtis, The Telegraph, 17th Sep 2013

Victoria and Albert Museum (London), acquired, for display in their collection, the world's first 3Dprinted gun, named "Liberator", developed and successfully fired by Texan law student Cody Wilson.

UK police raise specter of 3-D printermade guns

By Laura Smith-Spark, CNN, 25th Oct 2013

The U.S. State Department banned the inventor of a plastic handgun, "The Liberator," from distributing its instructions.

Police in England said Friday they have seized what could be the parts for Britain's first firearm made using 3-D printing -- but later said more testing is needed to establish if this is the case.
