

# **Industrial Automation**

## **(Automação de Processos Industriais)**

### **DES and Industrial Automation**

<http://users.isr.ist.utl.pt/~jag/courses/api1516/api1516.html>

Slides 2010/2011 Prof. Paulo Jorge Oliveira  
Rev. 2011-2016 Prof. José Gaspar

## Syllabus:

**Chap. 7 – Analysis of Discrete Event Systems [2 weeks]**

...

**Chap. 8 - DESs and Industrial Automation [1 week]**

GRAFCET / Petri Nets Relation

Model modification

Tools adaptation

Analysis of industrial automation solutions by analogy with  
Discrete Event Systems

...

**Chap. 9 – Supervision of DESs [1 week]**

## Some pointers to Discrete Event Systems

R. DAVID, H. ALLA, New York : PRENTICE HALL Editions, 1992

## DES Implementation: Models

Besides **modelling the DES** it is required to

design **models** of the **System to be controlled** and  
of the **Interface** to be used

## Given a Discrete Event System **how to implement it?**

### 1. Use a **GRAFCET**

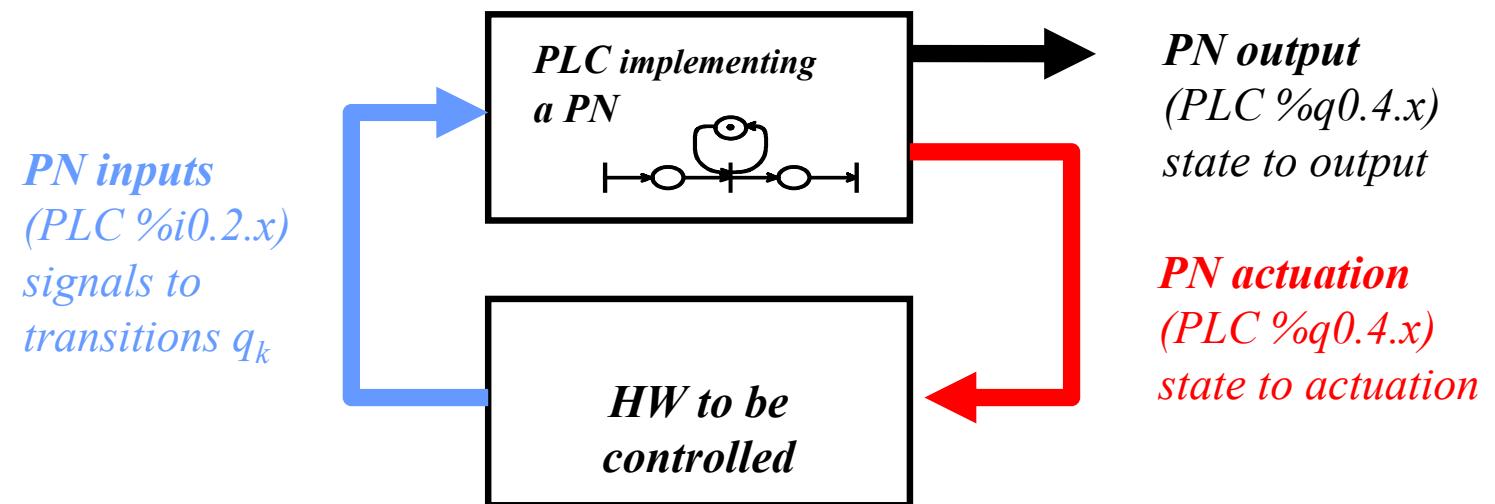

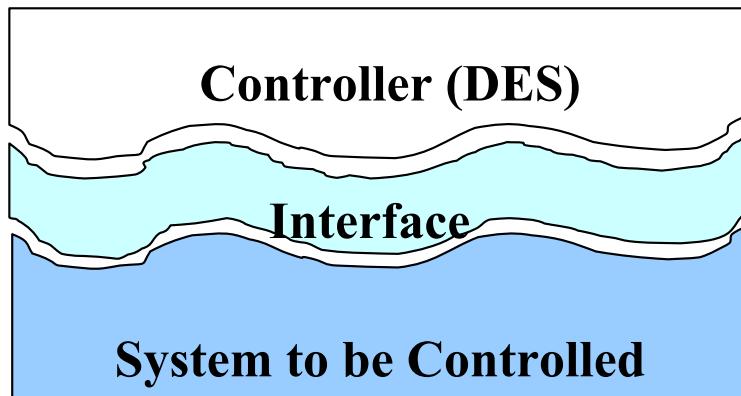

- a) Less modeling ability
- b) Implementation in PLCs is straightforward
- c) **No analysis (or very scarce) methods available**

### 2. Use a **Petri Net**

- a) More modeling capacity
- b) **No direct implementation in PLCs** (therefore indirect or special software solutions required)
- c) Classical analysis methods available

### (3. Use an **Automaton**)

# DES Implementation: Petri Net and HW (input / output)

# Analysis of solutions

## GRAFCET and Petri Nets

### Similarities to exploit:

- a) Steps and Places are similar
- b) Transitions compose both tools
- c) Places can be used to implement  
*counters* (on marking changes) and  
*binary variables* (marked vs  
unmarked place)
- d) *Logic* functions can be rewritten  
resorting to the firing of transitions

### Differences to be taken into account:

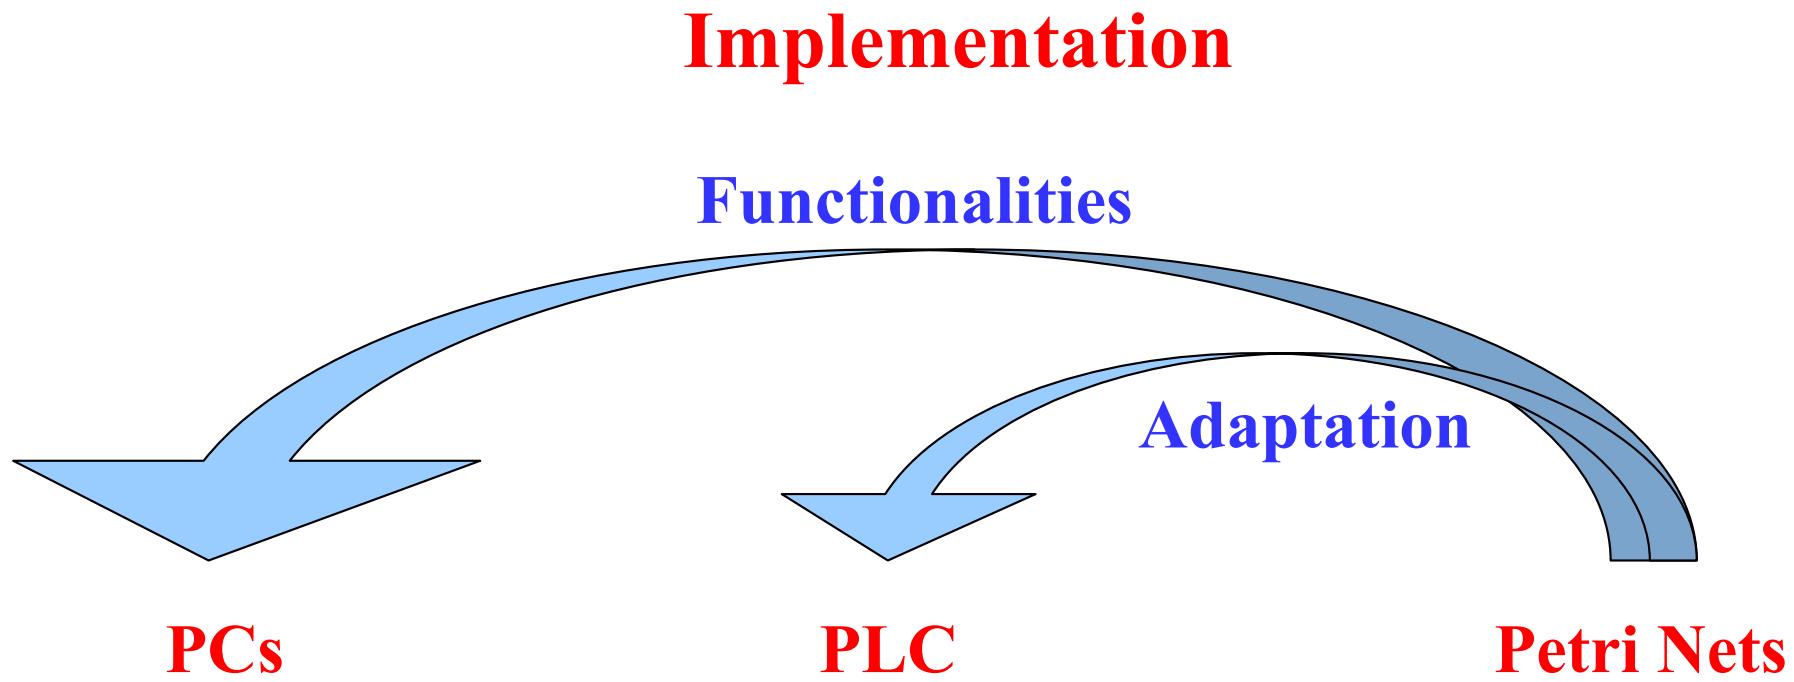

- a) Firing rules (mutual exclusion)
- b) Conflicts
- c) *Binary* activation of stages
- d) Interface with the system to be  
controlled
- e) Activation functions

# Implementation of DES using GRAFCET

## Analysis

# Implementation of DES using Petri Nets

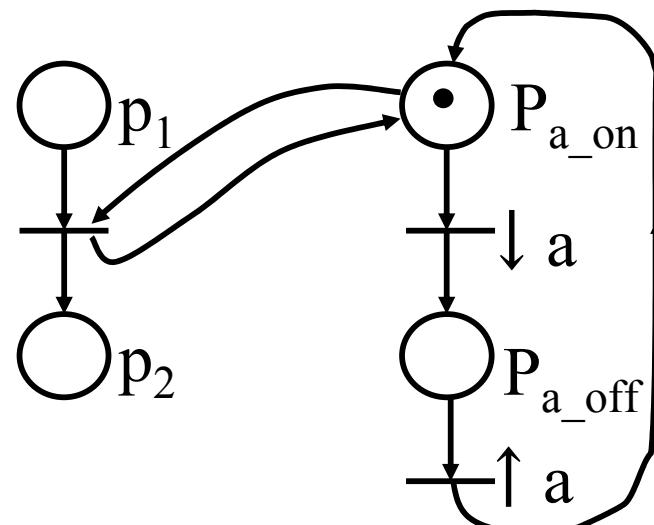

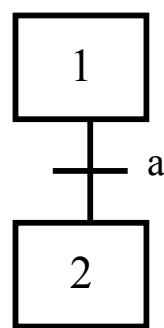

Both solutions are valid  
(but out of the scope of this course).

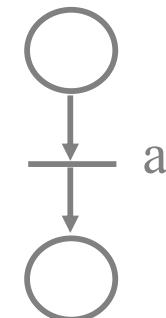

# Analysis of solutions

**GRAFCET → Petri Nets**

**Representation of variables active on level**

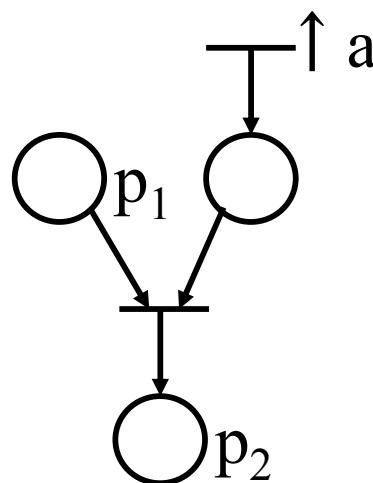

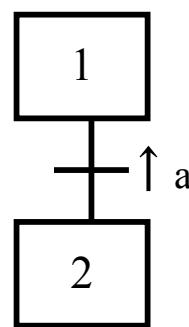

*In the course we accept  
the generalization of the PN*

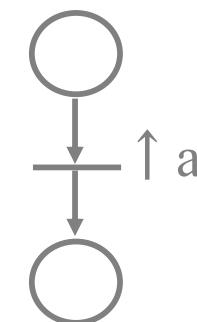

## Analysis of solutions

**GRAFCET → Petri Nets**

**Representation of variables active at edge**

*In the course we accept  
the generalization of the PN*

## Analysis of solutions

Petri Nets → GRAFCET

### Adaptation of Tools:

- 1) Reachability Tree → Reachability Graph
- 2) Method of the Matrix Equations  
to describe the state evolution

## Petri Nets → GRAFCET

### Reachability Graph

Is a graph containing the **reachable markings**.

Is composed by two types of nodes:

- terminal
- interior

The **duplicated** nodes are not represented. *They become connected to the respective copies.*

The **symbol infinity ( $\omega$ )** is not used in GRAFCET. *While in Petri nets  $\omega$  is necessary to obtain finite trees, when a marking covers other(s), in GRAFCET the finite number of states renders  $\omega$  unnecessary.*

## Petri Nets → GRAFCET

### Reachability Graph

**Theorem** - If a reachability graph has terminal nodes then the corresponding GRAFCET has deadlocks.

*This reachability graph will be used to study the properties introduced in Chapter 6.*

## Petri Nets → GRAFCET

### Reachable Set

Given the GRAFCET  $G=(S, T, I, O, \mu_0)$  with initial marking  $\mu_0$ ,  
the set of all markings that are reachable is the **reachable set**  $R(C, \mu_0)$ .

Property usage:  $\mu \in R(C, \mu_0)$

*Remark: the Reachable Set is not infinite!*

*Given a GRAFCET with  $m$  steps it has at most  $2^m$  nodes.*

*In some cases,  $m$  steps imply just  $m$  nodes.*

## Petri Nets → GRAFCET

### Safeness, Boundedness and Limitation

The GRAFCET  $G=(S, T, I, O, \mu_0)$  is always safe

*The GRAFCET may become not safe if one uses some auxiliary elements such as counters or buffers.*

*If one uses these auxiliary elements, the analysis methods studied for Petri Nets can be used to assert specific safeness, boundedness and limitation properties.*

## Petri Nets → GRAFCET

### Conservation

A GRAFCET  $G=(S, T, I, O, \mu_0)$  is **strictly conservative** if for all  $\mu' \in R(C, \mu_0)$

$$\sum_{p_i \in P} \mu'(p_i) = \sum_{p_i \in P} \mu_0(p_i).$$

A GRAFCET  $G=(S, T, I, O, \mu_0)$  is **conservative** if there exist a weight vector  $\omega$  without null elements, for all  $\mu' \in R(C, \mu_0)$  such that

$$\sum_{p_i \in P} \omega(p_i) \mu'(p_i) = constant$$

## Petri Nets → GRAFCET

**Liveness of transitions:** The transition  $t_j$  is live of

**Level 0** - it can never be fired (dead transition).

**Level 1** - if it is potentially firable, e.g. if there exist  $\mu' \in R(C, \mu)$  such that  $t_j$  is enabled in  $\mu'$ .

**Level 2** - if, for each positive  $n$ , there exist a sequence of firings where occurs  $n$  firings of  $t_j$ .

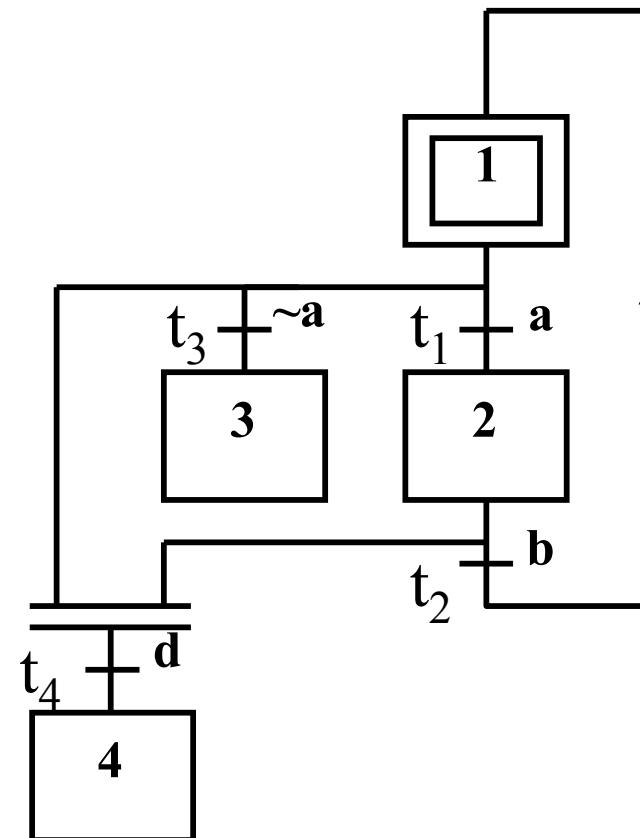

**Level 3** - if there exist a sequence of firings where an infinite number of firings of  $t_j$  occurs.

**Level 4** - if for each  $\mu' \in R(C, \mu)$  there exist a sequence  $\sigma$  that enables the firing of  $t_j$  (live transition).

## Petri Nets → GRAFCET

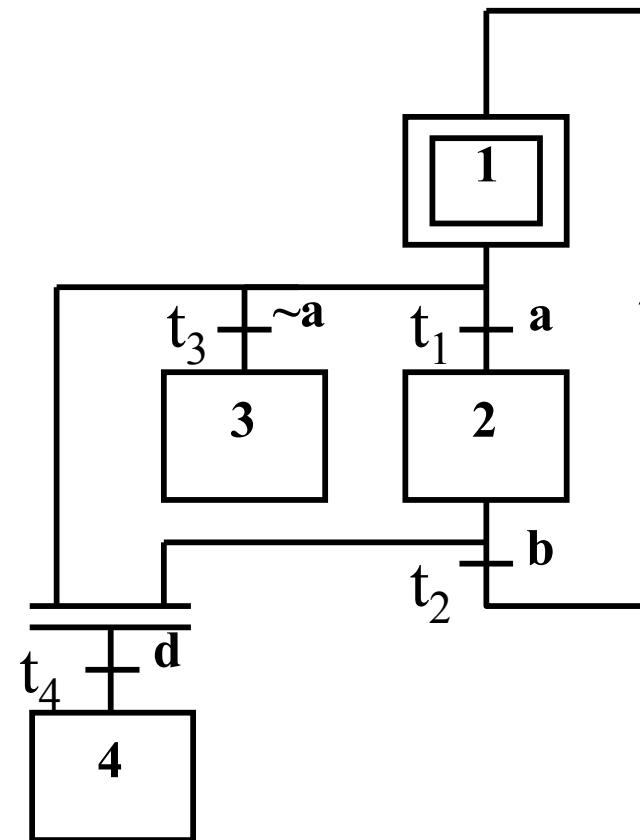

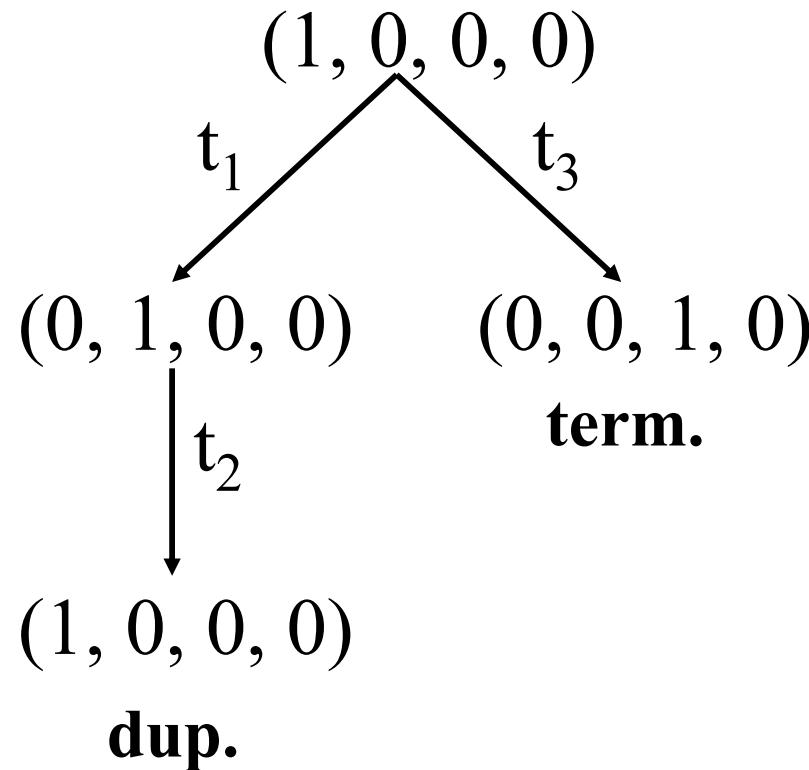

### Example of GRAFCET

- $t_1$  is level 3.
- $t_2$  is level 3.
- $t_3$  is level 1.
- $t_4$  is level 0.

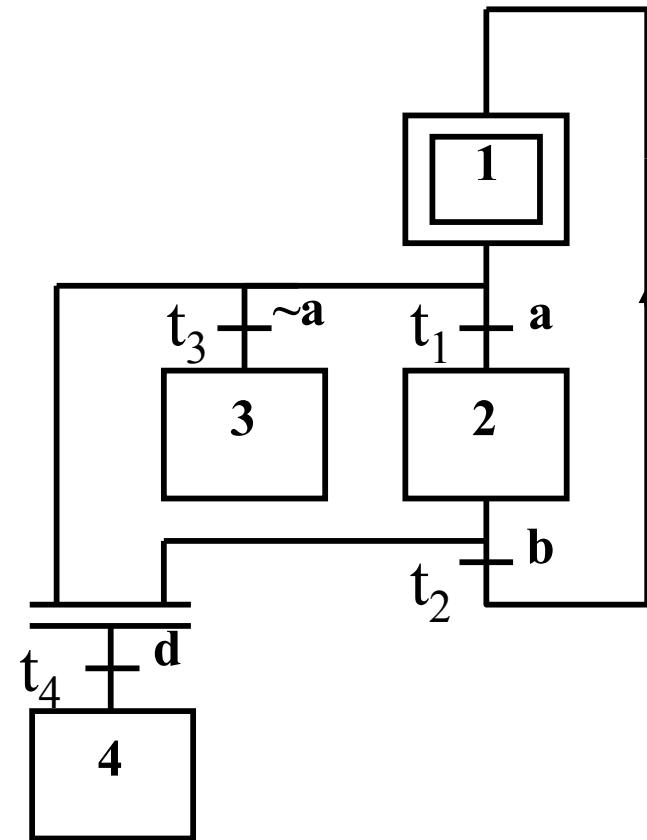

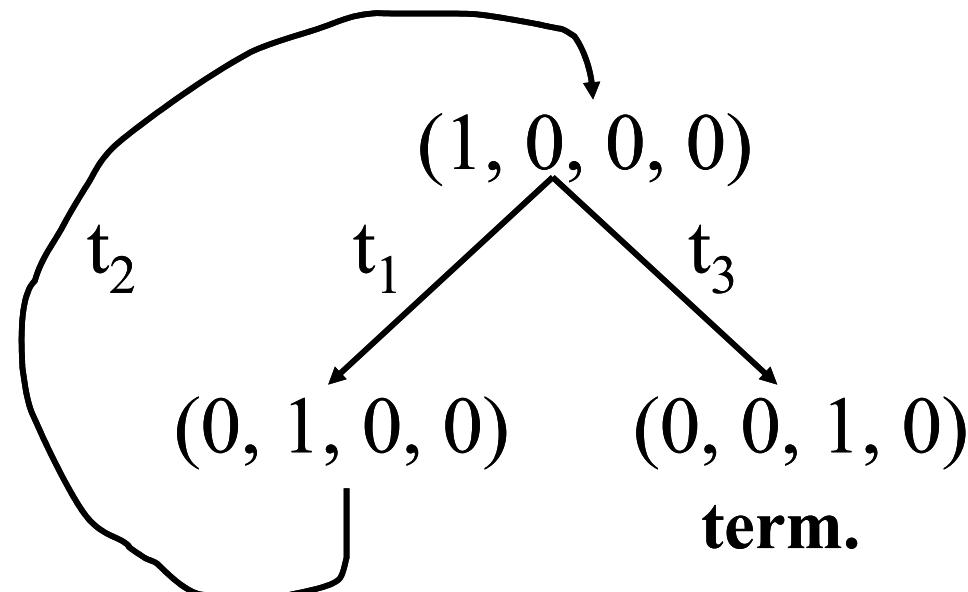

## Petri Nets → GRAFCET

### Example of GRAFCET

Petri Nets → GRAFCET

Example of GRAFCET

Strictly conservative.

## Petri Nets → GRAFCET

### Method of Matrix Equation (for the state evolution)

The evolution of a GRAFCET can be written in compact form as:

$$\mu' = \mu + Dq$$

where:

- $\mu'$  - Desired marking vector (column vector)
- $\mu$  - Initial marking
- $q$  - Transition firing vector (column vector)
- $D$  - Incidence matrix. Accounts for the token evolution as a consequence of transitions firing.

## Petri Nets → GRAFCET

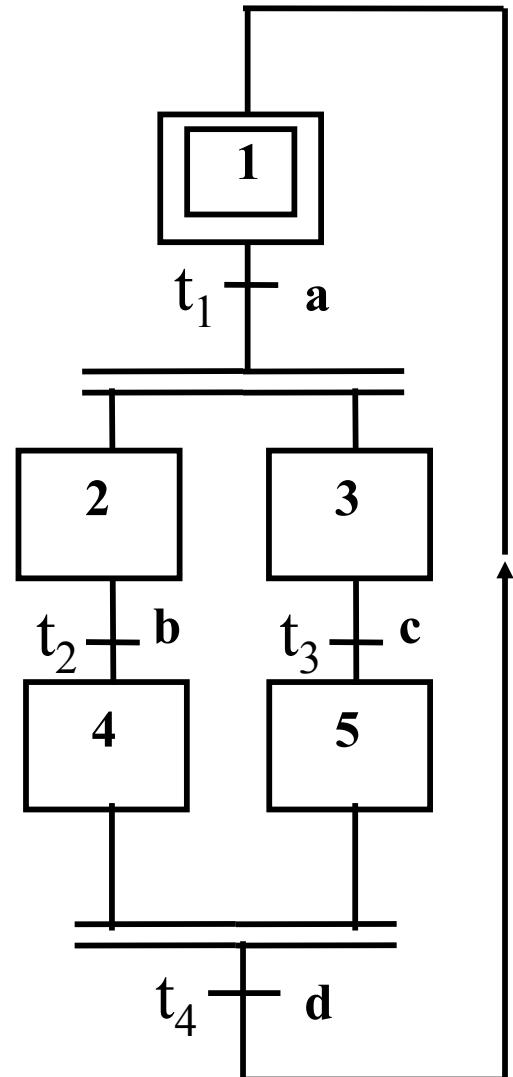

**Additional problems that can be addressed resorting to the Method of Matrix Equations:**

- **Reachability** (sufficient condition)

**Theorem** – if the problem of finding the vector of firings, for a GRAFCET without conflicts, from the state  $\mu$  to the state  $\mu'$  has no solution using the Method of Matrix Equations, then the problem of reachability of  $\mu'$  is impossible.

- **Conservation** – the conservation vector can be computed automatically.
- **Temporal invariance** – cycles of operation can be found.

## Example of GRAFCET

$$\mu' = \mu + Dq$$

$$D = \begin{bmatrix} -1 & 0 & 0 & 1 \\ 1 & -1 & 0 & 0 \\ 1 & 0 & -1 & 0 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & 1 & -1 \end{bmatrix}$$

Conservation

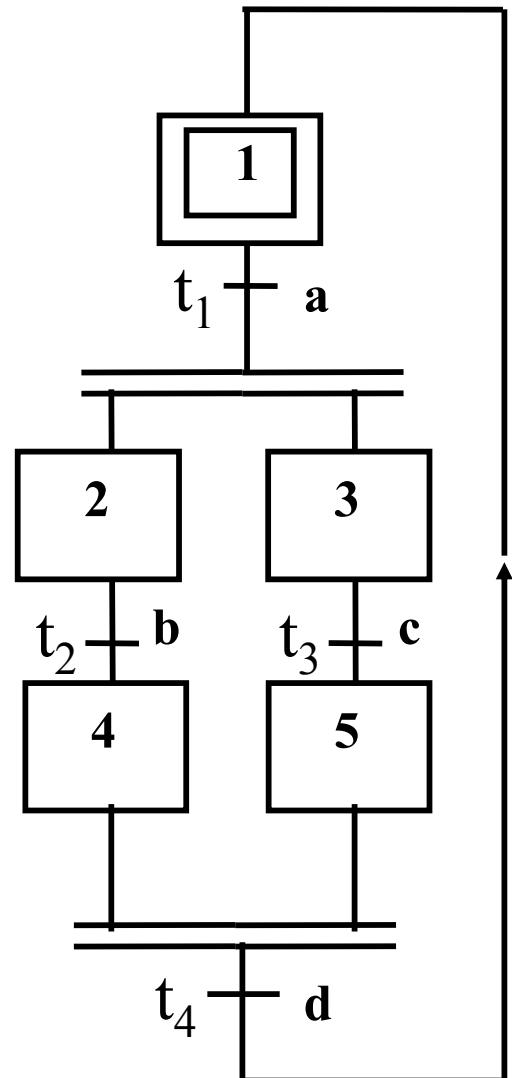

$$x^T D = 0$$

$$\begin{cases} -x_1 + x_2 + x_3 = 0 & x_1 = x_3 + x_4 \\ -x_2 + x_4 = 0 & x_1 = x_2 + x_5 \\ -x_3 + x_5 = 0 & x_2 + x_3 = x_4 + x_5 \\ x_1 - x_4 - x_5 = 0 & \end{cases}$$

Solution:  
Undetermined  
set of equations

$$x = \begin{bmatrix} 2 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}.$$

## Example of GRAFCET

$$\mu' = \mu + Dq$$

$$Dq = 0$$

$$D = \begin{bmatrix} -1 & 0 & 0 & 1 \\ 1 & -1 & 0 & 0 \\ 1 & 0 & -1 & 0 \\ 0 & 1 & 0 & -1 \\ 0 & 0 & 1 & -1 \end{bmatrix} \quad q = \begin{bmatrix} \sigma_1 \\ \sigma_2 \\ \sigma_3 \\ \sigma_4 \end{bmatrix}$$

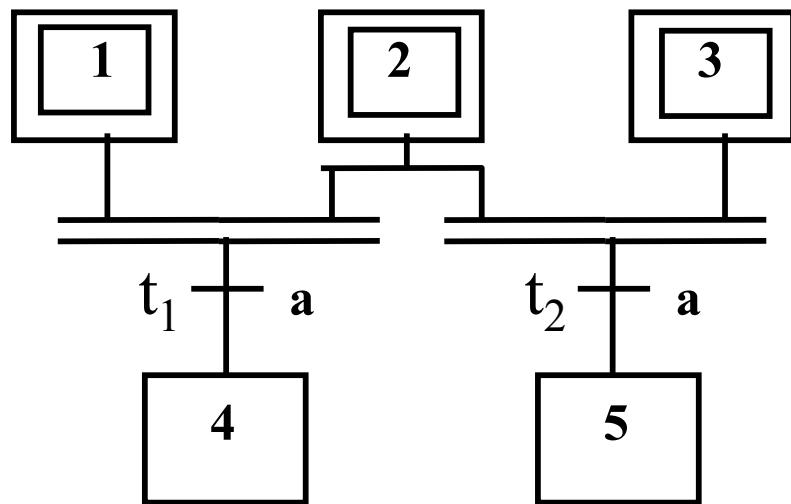

Temporal invariance

Solution:  
Set of equations  
with solution

$$\begin{cases} -\sigma_1 + \sigma_4 = 0 \\ \sigma_1 - \sigma_2 = 0 \\ \sigma_1 - \sigma_3 = 0 \\ \sigma_2 - \sigma_4 = 0 \\ \sigma_3 - \sigma_4 = 0 \end{cases}$$

$$\sigma_1 = \sigma_2 = \sigma_3 = \sigma_4 = 1.$$

## Example of GRAFCET

$$\mu' = \mu + Dq$$

$$\mu' = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \\ 1 \end{bmatrix} \quad \mu = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 0 \\ 0 \end{bmatrix} \quad D = \begin{bmatrix} -1 & 0 \\ -1 & -1 \\ 0 & -1 \\ 1 & 0 \\ 0 & 1 \end{bmatrix} \quad q = \begin{bmatrix} \sigma_1 \\ \sigma_2 \end{bmatrix}$$

Set of Equations **is impossible**  
therefore the marking **is not reachable...**

**WRONG !**

***The method fails if there are conflicts!***

$$\left\{ \begin{array}{l} 0 = 1 - \sigma_1 \\ 0 = 1 - \sigma_1 - \sigma_2 \\ 0 = 1 - \sigma_2 \\ 1 = \sigma_1 \\ 1 = \sigma_2 \end{array} \right.$$
